

## Molecular Solubility Prediction

# Project Scope

# Business Overview and Goals

## Business Need

- Production costs due to slow research
- Time for medication development
- Automating molecular solubility predictions

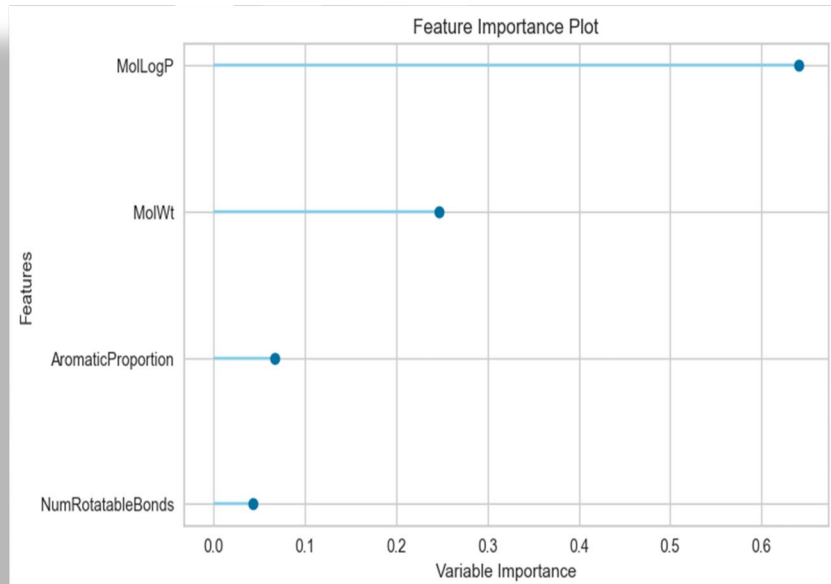

## Goals

- Identify Key Molecular/Compound Features
- Deliver Accurate ML Model
- Ability for business to Accurately predict molecular solubility

## Up Front Suggestion

- Extra Trees Regressor Model provided the best results

# Model Feature Analysis & Plotting

- MolLogP and Molecular Weight are the two variables with the most importance.
- The importance of these two variables impacts the score of the model

- Out of the 4 molecular descriptors, using only 2 features could provide an excess of 0.85 for the  $R^2$ .
- The use of the remaining two descriptors, will slightly improve the performance of the prediction.

## Linear Regression Model

The Linear Regression model is used as the main prediction model to be compared to the other models.

### Results

- $R^2$ : 0.76
- MSE: 1.01
- RMSE: 1.0112

## Model Results & Recommendation

Extra Trees  
Regressor

- Accuracy 90%

Random  
Forest  
Regressor

- Accuracy 86%

Linear  
Regression

- Accuracy 76%

Recommendation

- It's best for pharmaceutical companies to use the Extra Trees Regressor Model for molecular solubility prediction.
